

Underdetermined co-location decision

(i) Curable by transfer

calibrated interval;
guaranteed
 $P(\text{infeasible} \mid \text{commit}) \leq \alpha$.
Recovers 24.9% at
0 violations, no new
measurement.

(ii) Resolvable by measurement

live acquisition loop:
measure the Vol-ranked
axis (1-2 real probes).
100% coverage,
0 violations,
minimum-sufficient.

(iii) Structurally unmeasured

no measurement path
(e.g. governance);
the loop refuses
rather than fabricate.
